

To run the project, please follow the steps below:

### **For the website:**

We ran the project on localhost WAMP server. To do the same please install WAMP latest server. After installation a “wamp/www/” folder is created in the C Drive of the system. Please put the folder “sep” in the “wamp/www/” directory.

Now, please go to start menu, click on wamp server. Then click on “Start all services button”. After this we can go to the default browser and then type

“localhost/sep/index.html”

The “index.html” file is the main home webpage for our website. You can navigate further through the site via the links present on this webpage.

### **Configuring the database for the website:**

Extract the univ.zip file in the database folder and then copy the extracted univ folder to

“C:\wamp\bin\mysql\mysql5.6.17\data\”

The database has been configured.

### **For the Android application**

Copy and put the sep-debug.apk file into your android device. Now you can run the mobile application version of the website.

Thank You.
